

MOTION & CONTROL™

NSK

+ SELF-LUBE®

As one of the world's leading manufacturers of rolling bearings, linear technology components and steering systems, we can be found on almost every continent – with production facilities, sales offices and technology centres – because our customers appreciate short decision-making channels, prompt deliveries and local service.

Partnership based on trust – and trust based on quality

Total Quality by NSK: The synergies of our global network of NSK Technology Centres. Just one example of how we meet our requirements for high quality.

NSK is one of the leading companies with a long tradition in patent applications for machine parts. In our worldwide research centres, we not only concentrate on the development of new technologies, but also on the continual

improvement of quality based on the integrated technology platform of tribology, material technology, analysis and mechatronics.

Standard Self-Lube® insert references

List of common prefixes and suffixes

Prefixes

- B Unit or bearing insert supplied without locking collar.
- J Grease groove on the side of the bearing insert nearest to the locking device.
- T Triple lip sealed bearing insert.

Suffixes

- A Unit fitted with set screw lock insert with flush inner ring on one side.
- C4 Radial clearance greater than C3.
- CG Parallel outside diameter insert with grease groove and snap ring fitted.
- DEC Eccentric collar lock with extended inner ring.
- DL Double locking inner ring - 4 set screws (2 each end).
- EC Eccentric collar lock with flush inner ring on one side.
- FS Bearing insert fitted with flinger seals.
- G Bearing insert having relubrication facility.
- HLT High and low temperature bearing insert.
- K Bearing insert with tapered bore.
- L Larger than normal unit for the basic bore size.
- P Housing fitted with $\frac{1}{8}$ " BSP grease nipple (standard is $\frac{1}{4}$ " UNF).
- R Smaller than normal unit for the basic bore size.

Self-Lube® product range

NSK manufactures several ranges of mounted units. These include Self-Lube®, our recognised standard, and recently introduced ranges such as Silver-Lube®, Life-Lube® and Molded-Oil™ units. In each type, there are two basic components, the insert and the housing.

Self-Lube® bearing inserts

The Self-Lube® bearing insert, commonly known as a wide inner ring bearing, is designed to suit the wide range of housings offered by NSK in the Self-Lube® bearing family and is also suitable for applications where the user's own housing is preferred.

They are basically deep-groove ball bearings, to the popular 6200 series configuration, with integral design features making them more functional and versatile than standard ball bearings. The radial internal clearance is C3 for standard bearing inserts and bearings can be offered with either parallel or spherical outside diameter outer rings with the latter being the type fitted in the bearing unit. The integral design features of the bearing insert, such as shaft locking, sealing and lubrication, are explained in the following pages.

Self-Lube® bearing units

The range of Self-Lube® bearing units offers a wide choice of cast iron, pressed steel, synthetic rubber, thermoplastic or stainless steel housings fitted with spherical outside diameter Self-Lube® bearing inserts. They will generally accommodate initial housing misalignment up to 0.030 radians but are not recommended for running misalignment in excess of 0.001 radians.

The general housing types are pillow blocks, flange units, take-up units, cartridge units and hanger units. Choice is very much determined by the requirements of the application, although the aesthetic appearance of the machine design is often an important consideration. Self-Lube® units have been designed to meet the needs of both criteria.

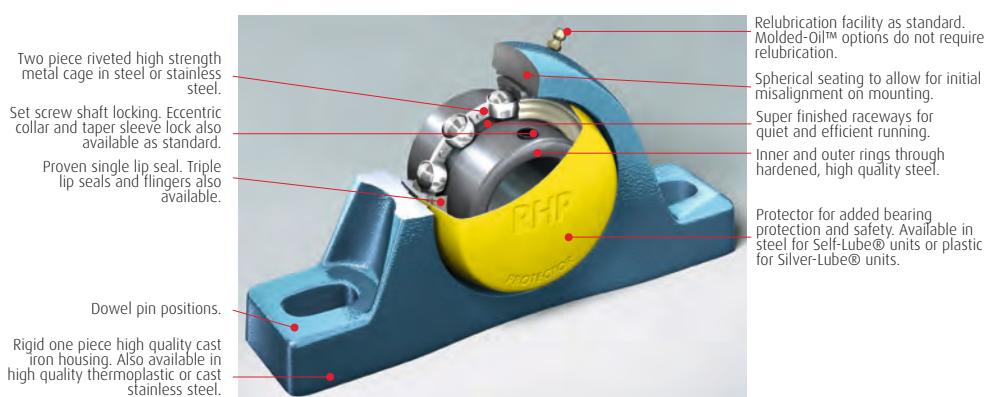

- › Cast iron unit castings are made from high-quality cast iron, and finished on unmachined surfaces with an electrostatic air-drying paint.
- › Pressed steel housings are made from mild steel strip, and are zinc plated.
- › Thermoplastic housings are moulded in highgrade PBT, a high quality thermoplastic polyester resin.
- › Stainless steel housings are made from austenitic stainless steel castings (SCS13).

Additional products

NSK recognises the need for 'tailor made' solutions and is always willing to help customers who have a requirement for something out of the ordinary.

Dynamic load ratings

The NSK dynamic load ratings given in this catalogue and the relationship between these and bearing fatigue life are based on ISO standard 281.

Bearing load ratings and endurance

Basic dynamic radial load rating C_r

This is defined as the load that can be applied to the bearing to give a basic L_{10} rating life of one million revolutions. This is the life associated with 90% reliability which has been found by experience to be acceptable for normal engineering bearing applications. The majority of the bearings attain a much longer life and the median life is approximately five times the L_{10} life. Ratings for each series are given in the bearing tables and are used to calculate life for radial loads of constant magnitude and direction.

Equivalent dynamic radial load P_r

For applications where axial and radial loads are present they must be converted into a single equivalent radial load P_r and calculated as follows, where:

F_r = actual radial load (N)

F_a = actual axial load (N)

Y = axial factor from table 18.2

C_{or} = basic static load rating

C_r = dynamic radial load rating

f_o = axial load factor

Note: Axial load F_a must not exceed 0.5 C_{or} .

Select f_o from table 18.1 for the appropriate bearing insert.

Calculate $\frac{f_o F_a}{C_{or}}$ and obtain the value of Y from table 18.2. Calculate P_r where:

$$P_r = F_r \quad \text{or}$$

$$P_r = 0.56 F_r + Y F_a$$

Use whichever P_r value is the greatest.

Relationship between load and life

Having determined the equivalent load P_r the nominal L_{10} bearing life is calculated as follows:

$$L_{10} \text{ life in hours} = \left(\frac{C_r}{P_r} \right)^3 \cdot \frac{10^6}{60n}$$

where n = bearing operating speed (rev/min).

Alternatively, by using the loading ratio $\frac{C_r}{P_r}$ the bearing L_{10} life can be estimated by reading off directly from the tables on page 12 under the appropriate speed column.

Basic static load rating C_{or}

This value is calculated in accordance with ISO standard 76. Ratings for each series are given in the bearing tables.

Static equivalent radial load P_{or}

When static axial and radial loads are applied to a bearing these must be converted to an equivalent static radial load P_{or} where:

F_{or} = actual static radial load (N)

F_{oa} = actual static axial load (N)

Calculate P_{or} where:

$$P_{or} = F_{or} \quad \text{or}$$

$$P_{or} = 0.6 F_{or} + 0.5 F_{oa}$$

Use whichever P_{or} value is greater, but this value **should not exceed** the bearing static radial load rating C_{or} .

Service factors

It is customary when calculating bearing life to include application factors which allow for fluctuations in loading that occur in service, and from experience the following may be used as a guide.

For steady and light shock loads multiply load by 1.2 to 1.5.

For moderate shock loads multiply load by 1.7 to 2.0.

When selecting the size of bearing for a given load, the calculated life should conform to the L_{10} lives shown in the next column:

- › Machines in use 8 hours/day - not fully utilised - 10,000 to 20,000 hours
- › Machines in use 8 hours/day - fully utilised - 20,000 to 30,000 hours.
- › Machines in use 24 hours/day - 40,000 to 80,000 hours.
- › Machines in seasonal use - 4,000 to 8,000 hours.

Limiting loads

The axial load F_{oa} must not exceed half the basic static load rating C_{or} . Housing strengths must also be considered as a limiting factor - see detail on page 17.

| Basic bearing insert | f_o | Basic bearing insert | f_o | $\frac{f_o F_a}{C_{or}}$ | Y |
|----------------------|-------|----------------------|-------|--------------------------|------|
| 1017 | 13.1 | 1060 | 14.3 | 0.172 | 2.30 |
| 1020 | 13.1 | 1065 | 14.4 | 0.345 | 1.99 |
| 1025 | 13.9 | 1070 | 14.4 | 0.689 | 1.71 |
| 1030 | 13.8 | 1075 | 14.7 | 1.03 | 1.55 |
| 1035 | 13.8 | 1080 | 14.6 | 1.38 | 1.45 |
| 1040 | 14.0 | 1085 | 14.7 | 2.07 | 1.31 |
| 1045 | 14.1 | 1090 | 14.5 | 3.45 | 1.15 |
| 1050 | 14.4 | 3095 | 13.6 | 5.17 | 1.04 |
| 1055 | 14.3 | | | 6.89 | 1.00 |

Examples of bearing calculations

Example 1

What nominal life can be obtained from NP55 with a steady radial load $F_r = 3900\text{N}$ at speed of 1500 rev/min? The dynamic load rating C_r of the unit from page 23 is 43500N. Since the bearing is not subject to axial load the equivalent load $P_r = F_r$ according to the formula on page 10. Therefore applying the service factor of 1.2 for a steady load.

$$P_r = F_r \cdot 1.2 = 3900 \cdot 1.2 = 4680\text{N}.$$

From page 10,

L_{10} life in hours

$$\begin{aligned} &= \left(\frac{C_r}{P_r} \right)^3 \cdot \frac{10^6}{n \times 60} \\ &= \left(\frac{43500}{4680} \right)^3 \cdot \frac{10^6}{1500 \times 60} \\ &= 8923 \text{ hours} \end{aligned}$$

Alternatively, using the loading ratio tables on page 12 an approximate life can be obtained by locating the nearest $\frac{C_r}{P_r}$ value in the appropriate rev/min column.

$$\text{Therefore } \frac{C_r}{P_r} = \frac{43500}{4680} = 9.29$$

Under the 1500 rev/min column the nearest $\frac{C_r}{P_r}$ value is 9.65 which gives an approximate life of 10000 hours.

Example 2

With a radial load $F_r = 2940\text{N}$ and an axial load $F_a = 1470\text{N}$ at 300 rev/min with moderate shock present, what nominal L_{10} life can be obtained from unit reference SF40? The dynamic radial load rating C_r of the unit from page 37 is 32500N and the static load rating C_{or} is 19900N. Since the bearing is subject to radial and axial loads we have to establish the equivalent load P_r according to page 10.

First, using the left hand table at the foot of page 10, we establish the value of $\frac{f_0 F_a}{C_{or}}$

$$\frac{f_0 F_a}{C_{or}} = \frac{14.0 \cdot 1470}{19900} = 1.03$$

Using this value in the right hand table at the foot of page 10, we establish a value for $Y = 1.55$.

From page 10 we then calculate the value of P_r

$$P_r = 2940\text{N}$$

or

$$P_r = 0.56 (2940) + 1.55 (1470) = 3925\text{N}$$

Using the greater value of P_r and applying an application factor of 1.7 (page 10) for moderate shock loads:

$$\begin{aligned} P_r &= 3925 \cdot 1.7 \\ &= 6673\text{N} \end{aligned}$$

From page 10:

L_{10} life hours

$$\begin{aligned} &= \left(\frac{C_r}{P_r} \right)^3 \cdot \frac{10^6}{60n} \\ &= \left(\frac{32500}{6673} \right)^3 \cdot \frac{10^6}{60 \times 300} \\ &= 6418 \text{ hours} \end{aligned}$$

Alternatively, using the loading ratio tables on page 12, an approximate life can be obtained by locating the nearest C_r/P_r value in the appropriate rev/min column. Therefore, $C_r/P_r = 32500/6673 = 4.87$.

Under the 300 rev/min column on page 12, calculated value of 4.87 is approximately mid-way between table values of 4.48 and 5.13. By interpolation, this gives an approximate life of 6250 hours.

Housing strength

To check the housing strength for example 2 when the axial load

$F_a = 1470\text{N}$ and applying an application factor of 1.7 then:
Axial load = $1470 \cdot 1.7 = 2499\text{N}$

From page 17 we see that the maximum axial loads for the above unit are:

0.45 C_{or} in one direction, and

0.25 C_{or} in the opposite direction.

Calculating these two maximum axial loads that may be applied to housing:

$$0.45 \cdot 19900 = 8955\text{N}$$

$$0.25 \cdot 19900 = 4975\text{N}$$

From the above it can be seen that the housing will support the axial load of 2499N in either direction.

Therefore, the unit above is satisfactory for the loading conditions stated.

Note It is advisable to shoulder the shaft for high axial loads.

Loading ratios

Life estimation for ball bearings for different C_r/P_r ratios and speeds

| L_{10} life (hours) | Speed: rev/min | | | | | | | | | |
|--------------------------|----------------|------|------|------|------|-------|-------|-------|-------|------|

Self-Lube® product range

Under the heading of Self-Lube® bearings there are two basic products: The Self-Lube® bearing insert and the Self-Lube® bearing unit.

Self-Lube® bearing unit

The range of Self-Lube® bearing units offers a wide choice of cast iron, pressed steel or synthetic rubber housings fitted with the full range of spherical outside diameter Self-Lube® bearing inserts. They will accommodate initial housing misalignment up to 0.030 radians but are not recommended for running misalignment in excess of 0.001 radians.

The general housing types are pillow blocks, flange units, take-up units, cartridge units and hanger units. Choice is very much determined by the requirements of the application, although the aesthetic appearance of the machine design is often an important consideration. Self-Lube® units have been designed to meet the needs of both criteria.

The castings are made from high-quality cast iron, and finished on unmachined surfaces with an electrostatic air-drying paint.

Pressed steel housings are made from mild steel strip, and are zinc plated. Rubber housings are moulded in antistatic nitrile rubber.

Self-Lube® Protector

The Self-Lube® Protector is designed to protect the machine operator from the dangers of rotating shaft ends and the external surfaces of the bearing from contamination.

The protector is made from good quality mild steel and coated with enamel paint making it robust, attractive and long lasting. It is easy to fit and can be removed without breakage or deformation thus allowing it to be refitted time after time.

Standard Self-Lube® inserts with spherical outside diameters have a 'groove' in the outer ring on the opposite side from the grease groove. The protector has two claws which locate through the casting loading slots into the 'groove' in the outer ring. This provides a very secure lock and makes the Protector difficult to dislodge. The user of Self-Lube® units is not required to purchase special bearings or provide any additional locking device in order to obtain this secure safety feature.

The Protector can be removed by inserting a form of lever device into a small hole in one of the claws and exerting slight pressure outwards. This disengages the claw from the outer ring 'groove'. A replaceable cover for the hole is provided.

Sealing and Lubrication

Relubrication of Self-Lube Bearings

NSK Self-Lube Bearings are factory charged with the correct amount of grease and do not require a further grease charge when being fitted.

Relubrication is not normally necessary except when operating at extremes of temperature, speed and loading, or where excessive wet or dirty conditions exist.

The relubrication frequency varies with the type and quality of grease used as well as the operating conditions. Therefore, it is difficult to establish a general rule, but under ordinary operating conditions, it is desirable that grease be replenished before one third ($\frac{1}{3}$) of its calculated life elapses. It is necessary, however, to take into consideration such factors as hardening of grease in the oil hole, making replenishment impossible, or deterioration of grease due to oxidation while the machine is running.

The table shows standard relubrication frequencies. Irrespective of the calculated life of the grease, this list takes into consideration such factors as the rotational speed of the bearings, operating temperatures and environmental conditions, with a view to safety.

The performance of a bearing is greatly influenced by the quantity of grease. In order to avoid overfilling, it is advisable to replenish the grease while the machine is in operation. Continue to insert grease until a little oozes out from beneath the sealing lip on the inner ring for optimum performance.

All standard Self-Lube bearing units have 1/4"-28UNF grease nipples, except for the FC series units which have M5 x 0.8mm pitch grease nipples.

Lubrication

| Unit | Unit temperature range | Grease | Supplier |
|-----------------|------------------------|-----------------------|----------|
| Standard insert | -20°C to +110°C | Alvania S2 | Shell |
| HLT insert | -40°C to +180°C | Kluberquiet BQH72-102 | Kluber |

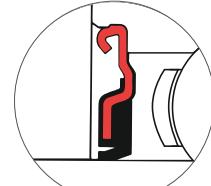

Standard relubrication frequencies

| Type of unit | dn Value | Environmental conditions | Operating temp °C, °F | Relubrication frequency Hours | Period |
|--------------|-----------------|---------------------------|------------------------------|-------------------------------|----------------|
| Standard | 40000 and below | Ordinary | -15 to +80 +5 to +176 | 1500 to 3000 | 6 to 12 mo. |
| Standard | 70000 and below | Ordinary | -15 to +80 +5 to +176 | 1000 to 2000 | 3 to 6 mo. |
| Standard | 70000 and below | Ordinary | +80 to +100 +176 to +212 | 500 to 700 | 1 mo. |
| HLT | 70000 and below | Ordinary | +100 to +130 +212 to +266 | 300 to 700 | 1 mo. |
| HLT | 70000 and below | Ordinary | +130 to +180 +266 to +356 | 100 to 300 | 1 wk. |
| HLT | 70000 and below | Ordinary | -60 to +80 -76 to +176 | 1000 to 2000 | 3 to 6 mo. |
| Standard | 70000 and below | Very dusty | -15 to +100 +5 to +212 | 100 to 500 | 1 wk. to 1 mo. |
| Standard | 70000 and below | Exposed to water splashes | -15 to +100 +5 to +212 | 30 to 100 | 1 day to 1 wk. |

dn = bore diameter (mm) · speed (rpm)

Single Lip Seal

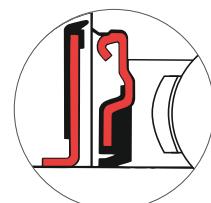

The S-type seal, which is firmly secured in the bearing outer ring, comprises a nitrile rubber sealing element (black in colour) bonded to a strong steel former. The flexible sealing lip contacts the fine ground finish of the inner ring to give low friction with effective sealing.

Single lip seal (standard)

Flinger seal

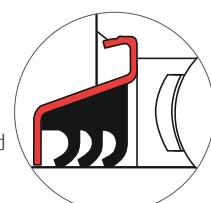

Where extra protection is required without loss of bearing catalogue speed, the 'Flinger seal' is ideal. It consists of a steel flange to which is bonded a flexible nitrile sealing lip. They are offered for the 1000G and 1000DECG types and are identified with the suffix FS (e.g. 1025-25GFS, NP25FS). The flinger is fitted to the inner ring.

Single lip seal + flinger seal

Triple lip seal

For applications with a high degree of contamination, the specially developed RHP triple lip seal is recommended. It consists of a one-piece moulded nitrile seal with three sealing lips, bonded to a protective steel outer pressing which is strongly secured in the outer ring making a highly efficient sealing arrangement. It is not recommended for high speeds. See pages 86 to 88.

Triple lip seal

Shaft locking arrangements

Set screw lock

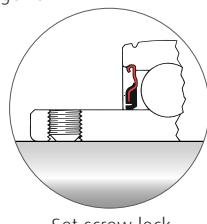

This locking arrangement consists of two knurled cup-point, self-locking, socket-head set screws fitted in the extended inner ring.

For normal loads and moderate speeds simply mount the bearing unit into position and tighten down the set screws to the recommended torque value.

Additional security can be achieved by spot drilling the shaft to accommodate the set screw point. When spot drilling, first remove the set screw and locate the position on the shaft. Select a drill the size of the inner ring threads minor diameter, and drill through this hole into the shaft to the depth of the drill point.

Replace the set screw and tighten onto the shaft in the normal manner.

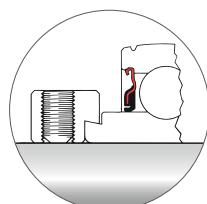

The recommended tightening torques for the set screws are given on page 16.

Set screw lock

Eccentric collar lock

This type of lock consists of an eccentric diameter formed on the extended inner ring of the bearing which engages a similarly formed eccentric diameter in the bore of a separate collar. Locking is achieved by turning the collar in the direction of the shaft rotation until the eccentric diameters of both collar and inner ring are fully engaged. The collar is provided with a blind hole to facilitate tightening when locking the bearing to the shaft. The set screw when tightened to the recommended torque values on page 16 prevents the collar 'backing off' in service.

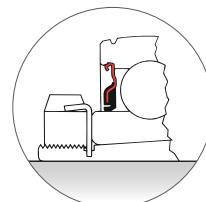

Eccentric collar lock

Taper sleeve lock

This locking arrangement, which incorporates a standard taper adapter sleeve, locknut and lock washer, is recommended when a positive concentric (shaft) lock is required.

When fitting the bearing to the shaft, care must be taken to ensure that the locknut is not over-tightened as this can eliminate the bearing internal clearance, resulting in premature failure. A lockwasher is provided which prevents the locknut 'Backing off' when one of the tabs is engaged with the corresponding notch in the locknut. (See below for fitting instructions).

The recommended tightening torques for the locknuts are given on page 16.

Taper sleeve lock

Mounting Self-Lube® adapter sleeve units

- › First bolt the Self-Lube® housing to the equipment and clean the shaft and sleeve bore of any oil or grease.
- › Position the shaft within the unit and tighten up the locknut by hand. If the sleeve assembly turns on the shaft tap the sleeve into the bearing to give a positive grip. Tighten locknut to recommended torque value given on page 16.
- › Where torque spanner facilities are not available a blunt drift and small hammer may be used to tighten the nut.
- › Check that the bearing rotates freely, to ensure that the internal clearance has not been totally removed and that preload has been avoided.
- › Finally, secure the nut with the appropriate tab on the locking washer. Tighten the nut slightly if necessary but never back the nut off.
- › After 100 hours running it is advisable to check the tightness of the locknut.

| 50mm, 1 15/16", 2" | 85 | 750 |

Mounting instructions for Self-Lube® bearing units

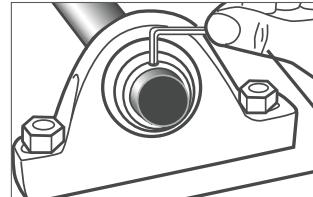

Self-Lube® set screw locking arrangement units

1. Relieve set screws clear of the bore and slide bearing onto the shaft.

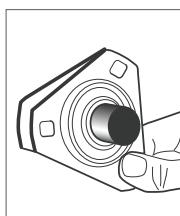

2. Bolt the unit down on to a flat surface but do not over-tighten.

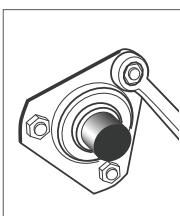

3. Tighten set screws to recommended torque

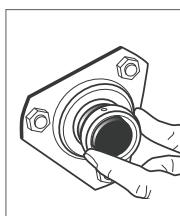

Self-Lube® eccentric collar locking arrangements units

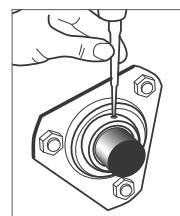

1. Assemble bearing and housing and slide onto the shaft. Do not engage collar.

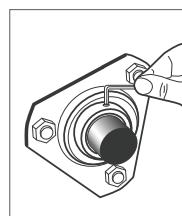

2. Lightly tighten bolts, repeat at other end of shaft and then finally tighten bolts on both sides.

3. Engage the eccentric collar in direction of shaft rotation.

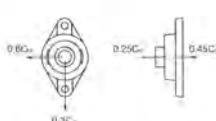

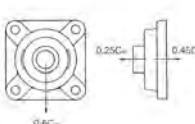

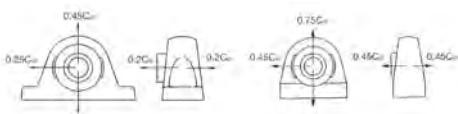

4. Tighten collar with drift pin and small hammer.

5. Tighten collar set screw to recommended torque.

Housing strength limits

Radial Loads Axial loads

Maximum recommended steady housing loads

The maximum loads shown adjacent are given as a proportion of the static load rating (C_{or}) of the bearing insert. Where the value of the axial load exceeds the set screw maximum axial holding load listed on page 16, a shoulder on the shaft must be provided against the face of the inner ring.

For shock load conditions additional safety factors must be applied.

For most applications the standard set screw lock is more than satisfactory. Whenever eccentric collar units are used it is recommended that shaft tolerances in the high loads column be adopted. Whenever taper adapter sleeve locking arrangements are used, shaft tolerances in the light loads column can be adopted. When operating conditions are very severe (for example, in case of heavy vibration or shock) a light interference fit may be required between the shaft and bearing bore diameter.

Bearing inserts with flinger seals shown on pages 89 and 90 can be fitted into these housings. The unit reference has the suffix 'FS', e.g. SF25FS.

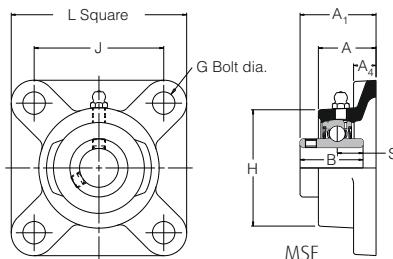

Triple seal bearing inserts shown on pages 86 to 88 can be fitted into these housings. The unit reference has a prefix 'T', e.g. TSF25.

** For these bore sizes select from ST series (see page 54)

Bearing inserts with flinger seals shown on pages 89 and 90 can be fitted into these housings. The unit reference has the suffix 'FS', e.g. MST35FS.

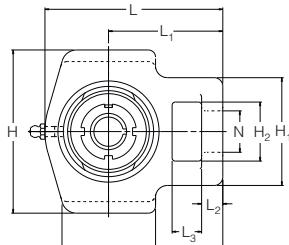

Triple seal bearing inserts shown on pages 86 to 88 can be fitted into these housings. The unit reference has a prefix 'T', e.g. TMST35.

** For these bore sizes select from SLC Series (see page 62)

Bearing inserts with flinger seals shown on pages 89 and 90 can be fitted into these housings. The unit reference has the suffix 'FS', e.g. MSC 1 3/16 FS.

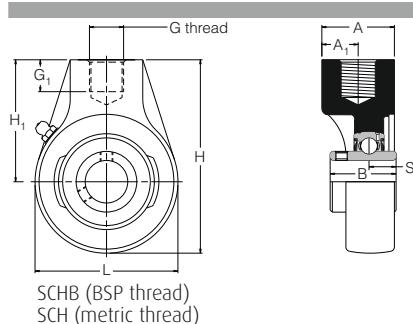

Triple seal bearing inserts shown on pages 86 to 88 can be fitted into these housings. The unit reference has a prefix 'T', e.g. TMSC 1 3/16.

Please check availability

A modified version of these units is available if a Protector is to be fitted, see page 91 for details

**Note: These units are not re-greaseable

Bearing inserts with flinger seals shown on pages 89 and 90 can be fitted into these housings. The unit reference has the suffix 'FS', e.g. SLFL1FS.

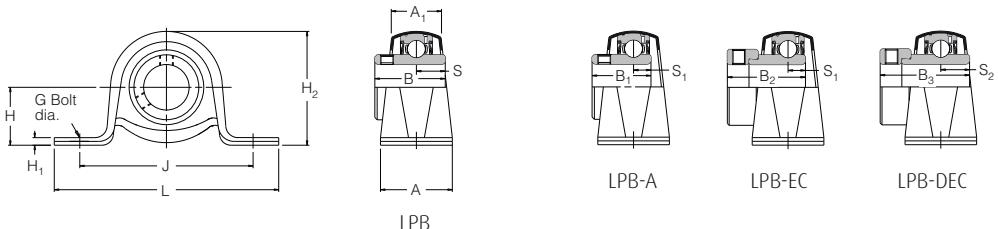

Triple seal bearing inserts shown on pages 86 to 88 can be fitted into these housings. The unit reference has a prefix 'T', e.g. TSLFL1.

* Please check availability of units (protectors are available, but special SLFEP flangeettes may not be).

Note 1: The appropriate protector is determined by the basic bearing insert group.

Note 2: When a pressing from the series SLFL, SLFE or SLFT is fitted with a protector, the unit reference includes the letter "P", e.g. SLFEP-25EC.

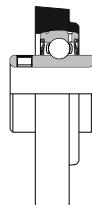

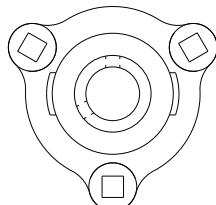

Additional Products

LF series, LFG series

A range of three bolt spheroidal graphite iron housed units, available in bore sizes 25mm to 35mm and 1" to $1\frac{7}{16}$ ".

LF series units are not re-greaseable.

LFG series units use an M5 grease nipple.

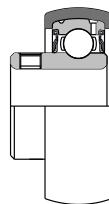

LF series

AR-A series, AR-EC series

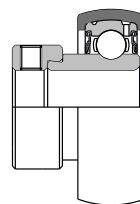

The AR series is the bearing and rubber cartridge used in the LPBR unit (Pages 76 and 77).

Available as a series for users who have their own housing.

Bore sizes 12mm to 30mm and $1\frac{1}{2}$ " to $1\frac{1}{4}$ ".

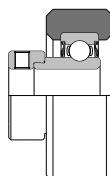

AR-A series

AR-EC series

SRM-EC series

Rubber housed units fitted with the 1120 or 1125 type inserts. Available in bore sizes 20mm, $\frac{3}{4}$ ", 25mm, $\frac{7}{8}$ " and 1" with eccentric collar or set screw lock.

SRM-EC series

SRC-EC series

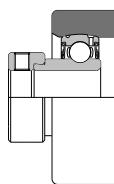

Rubber housed units suitable for the air conditioning market, two housings each with an outside diameter of 64,5mm and in bore sizes 20mm to 25mm and $\frac{3}{4}$ " to 1" are available.

Special SRC types

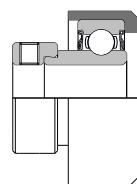

Bore sizes 20mm and $\frac{3}{4}$ ".

Offered with eccentric collar lock.

(SRC11004 and SRC11005 respectively.)

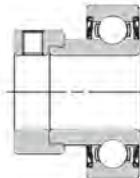

SRC-EC series

Special SRC series

2300-EC extra light series

The 2300-EC series is an extra light bearing, based on the 6000 series configuration, and is available in bore sizes 20mm to 30mm and $\frac{3}{4}$ " to $1\frac{3}{16}$ ".

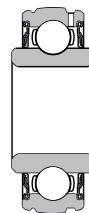

2300-EC
extra light series

1600-G series, 1600-HG series

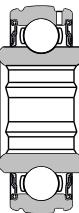

A range of spherical outside diameter deep groove wide inner ring ball bearings with either round or hexagonal bores.

These are re-greaseable and available in round bore sizes 20mm to 75mm and $\frac{3}{4}$ " to $2\frac{15}{16}$ " and hexagonal bore sizes $\frac{7}{8}$ " AF to $1\frac{1}{2}$ " AF and 22mm AF to 38mm AF. Round bore diameters are an interference fit on the shaft.

The standard Self-Lube cage and seals are fitted.

1600-G series

1600-HG series

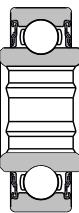

1700 series, 1700-H series

As 1600-G, 1600-HG but with parallel outside diameters, although this range is not re-greaseable.

Again, round bore diameters are an interference fit on the shaft.

1700 series

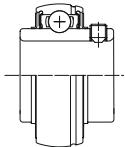

1700-H series

Silver-Lube® product range

Introduction

The Silver-Lube® series is a range of corrosion resistant bearing units specifically for use in industries where frequent thorough washdowns are necessary, optimum hygiene standards are required and good chemical resistance is important over a wide temperature range.

The units are available in pillow block, two-bolt flange, four-bolt flange and take-up unit configurations and are capable of accommodating initial misalignment from mounting errors. In operation the units have proven reliability in the most hostile applications. Relubrication is possible for long trouble-free life, minimising maintenance, maximising productivity and helping maintain hygiene standards.

Silver-Lube® housings are made from PBT thermoplastic resin which, in addition to being non-corrodible, is resistant to detergents and a wide range of chemicals. The housings are paint and coating free which prevents chipping or flaking and have smooth surfaces to assist thorough washdowns.

Silver-Lube® bearing inserts are made from stainless steel, are provided with effective, efficient sealing arrangements and are charged with an aluminium complex, high temperature approved food grade grease as standard.

For Silver-Lube® bearings the radial internal clearance (RIC) is C3.

Housing strength

Housing load carrying capacity varies depending on the application loading regime, which may be intermittent, continuous or cyclical. Maximum housing loads are given in tables 1, 2, 3 and 4. These loads must not be exceeded without prior consultation with NSK.

Published housing maximum load capacities do not allow for any reduction in housing strength caused by exposure of the housing to chemicals, water, steam, heat, ultraviolet light or any combination of these factors. If any of these factors are present in the application the designer or end-user must establish the effect of these exposures and reduce the published maximum housing load accordingly.

To maximise load carrying capacity it is recommended that washers are used with the fixing bolts. Tables 1, 2 and 3 also detail maximum fixing bolt tightening torques.

Static electricity generation

Static electricity may be generated by Silver-Lube® bearing units under certain application conditions.

Silver-Lube® bearings are therefore not recommended for use in explosive or flammable environments. If Silver-Lube® bearing units are used in flammable or explosive applications the bearing insert must be earthed.

Housing strength

PST Series

Silver-Lube® bearing inserts

Silver-Lube® bearing inserts have martensitic stainless steel rings and balls, and austenitic stainless steel ball cage, flingers and set screws, in addition to durable and heat-resistant silicone rubber seals

The grease in this product is an aluminium complex food grade grease, classified to NSF grade H1. In the event of relubricating being necessary, this type of grease is the first choice replacement.

If an aluminium complex food grade grease is not available, it is essential that any alternative grease is NSF H1 approved and ideally chemically compatible with the original grease. If chemical compatibility cannot be assured, then it is recommended that the original grease is completely flushed out of the system before relubrication. NSK should be consulted where necessary.

Shaft tolerances and permissible speeds

Bearing insert permissible speed is dependent on shaft tolerance. For higher speed applications an ISO h7 shaft tolerance is recommended. An ISO h9 shaft tolerance may be used for low speed applications. For more information see table 6.

Table 6 Tolerances and Speeds

| Basic bearing insert | Bearing limiting speed (RPM) | ISO h7 Shaft tolerance high (0.001 mm Units) | ISO h7 Shaft tolerance low (0.001 mm Units) | Bearing limiting speed (RPM) | ISO h9 Shaft tolerance high (0.001 mm Units) | ISO h9 Shaft tolerance low (0.001 mm Units) |

Materials and tightening torques

Materials

| | Parts | Materials |
|-----------------|---------------|---|
| Bearing | Bearing Rings | Martensitic stainless steel (equivalent to SUS440C) |
| | Ball | Martensitic stainless steel (equivalent to SUS440C) |
| | Flinger | Austenitic stainless steel (equivalent to SUS302) |
| | Rubber Seal | Silicone Rubber |
| | Set Screw | Austenitic stainless steel (equivalent to SUS304) |
| | Cage | Austenitic stainless steel (equivalent to SUS302) |
| Bearing housing | | Thermo Plastic PBT |

Set screw tightening torques

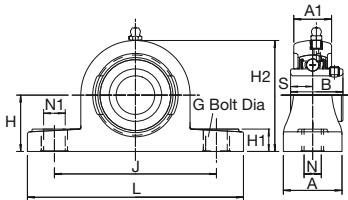

Set screws for Silver-Lube® bearing inserts are manufactured from stainless steel and can fracture if overtightened. The limiting set screw torques listed (in Table 7) should not be exceeded.

Table 7 Recommended tightening torques for set screws

End Covers

Polypropylene end covers are available to fit all Silver-Lube® housings. End covers can be used at temperatures ranging from -20°C to +90°C. They may be used as additional protection for the bearing in adverse environmental conditions as well as an aid to meeting safety requirements.

Ball bearing units stainless series

Introduction

This series provides corrosion resistance and longer lubrication life in a clean unit with low torque characteristics.

NSK ball bearing units in the stainless series feature ball bearings inserted into housings made of stainless that provide superior resistance to corrosion as compared to standard series cast iron units. This series is especially useful in a wide variety of applications because of the rust-free properties of the housing.

Molded-Oil™ bearings are lubricated with NSK's own oil-impregnated material, Molded-Oil™. Molded-Oil™ consists of lubricating oil and polyolefin resin that has an affinity for oil. Oil slowly seeping from this material provides ample lubrication to the bearing for extended periods.

As oil seeping from the Molded-Oil™ inside the bearing provides sufficient lubrication, troublesome oil refilling is not required and contamination of the surrounding environment is prevented.

Prior to filling the bearings with Molded-Oil™, their interior surfaces are specially treated. As a result, bearing torque is not much higher than that of grease-lubricated bearings.

The basic dimensions are the same as current NSK units and are also compatible with units from other manufacturers ISO standard.

Materials

| | Parts | Materials |
|-----------------|--------------------------------|---|
| Bearing | Raceways | Martensitic stainless steel (equivalent to SUS440C) |
| | Ball | Martensitic stainless steel (equivalent to SUS440C) |
| | Flinger, Retainer | Austenitic stainless steel (equivalent to SUS304) |
| | Rubber Seal | Nitrile rubber |
| Bearing housing | Set Screw (W shape screw head) | Martensitic stainless steel (equivalent to SUS410) |
| | | Austenitic stainless steel casting (SCS13) |

Recommended operating temperature and allowable speed

Molded-Oil™ bearings are recommended to operate from -15 to +80°C. However, operating temperature should be below +60°C when the bearing is operated under continuous use.

dn value: $12 \cdot 10^4$ max

(dn = bore diameter in mm x speed in min^{-1})

Remarks: This recommended operating temperature range and allowable speed is applied to all bearings with Molded-Oil™ bearings. Contact NSK when your application exceeds these recommendations.

Recommended tightening torques for set screws

| Bearing designation (F-UC) | Designation of set screws (W shape on screw head) | Maximum tightening torque (Nm) |
|----------------------------|---|--------------------------------|
| 204, 205 | M5 x 0.8 | 3.9 |
| 206 | M6 x 0.75 | 4.9 |
| 207 | M6 x 0.75 | 5.8 |
| 208-210 | M8 x 1 | 7.8 |

Inner ring tolerances

Units: μm

| Nominal bore diameter d over mm | incl. mm | Bore diameter | | Width | | Radial run-out (ref.) max |
|------------------------------------|----------|--|---|------------------------------------|-----------------------------------|------------------------------|
| | | Δd_{mp} deviations high | Δd_{dp} variations low | ΔB_s deviations high | ΔB_s deviations low | |
| 18 | 31.750 | +18 | 0 | 12 | 0 | -120 |
| | 31.750 | +21 | 0 | 14 | 0 | -120 |

Δd_{mp} : Mean bore diameter deviation.

Δd_{dp} : Bore diameter variation.

ΔB_s : Inner ring width deviation.

Outer ring tolerances

Units: μm

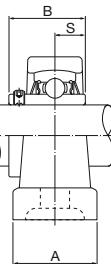

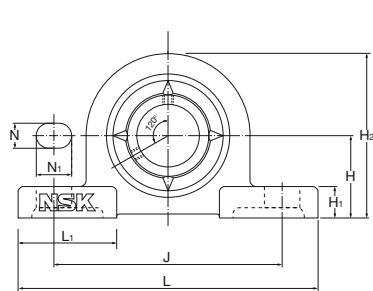

| Nominal outside diameter D over mm | incl. mm | ΔD_m deviations | | Radial run-out (ref.) max |
|---------------------------------------|----------|-------------------------|-----|------------------------------|
| | | high | low | |
| 30 | 50 | 0 | -11 | 20 |
| 50 | 80 | 0 | -13 | 25 |
| 80 | 120 | 0 | -15 | 35 |

ΔD_m : Mean outside diameter deviation.

The lower deviation figure of ΔD_m does not apply within a distance of $\frac{1}{4}$ the width of the outer ring from either side.

Molded-Oil™ lubrication system

Life-Lube® product range

Introduction

The Life-Lube® series combine the corrosion resistant properties of Silver-Lube® housings with the excellent sealing and lubricating properties of Molded-Oil™ inserts. Life-Lube® units are specifically for use in industries where contact with water and process fluids is unavoidable, excellent chemical resistance is required and a longer lubrication life is necessary.

Life-Lube® units are available in pillow block, two-bolt flange, four-bolt flange and take-up unit configurations and are capable of accommodating initial misalignment from mounting errors. In operation, the units have proven reliability in the most hostile applications.

Life-Lube® housings are made from PBT thermoplastic resins which, in addition to being non-corrodible, are resistant to detergents and a wide range of chemicals. The housings are paint and coating free which prevents chipping or flaking and have smooth surfaces to assist in washdowns.

Life-Lube® bearing inserts are made from stainless steel which provides superior corrosion resistance. The inserts are lubricated with NSK's own oil impregnated polymer, Molded-Oil™. Oil slowly seeping from this material provides ample lubrication for the bearing for extended periods. The Molded-Oil™ solid lubricant resists contamination and water washout and does away with the need for relubrication. Stainless steel flingers and nitrile rubber seals are fitted as standard.

Housing strength

Housing load carrying capacity varies depending on the application loading regime, which may be intermittent, continuous or cyclical. Maximum housing loads are given in tables 1, 2, 3 and 4. These loads must not be exceeded without prior consultation with NSK.

Published housing maximum load capacities do not allow for any reduction in housing strength caused by exposure of the housing to chemicals, water, steam, heat, ultraviolet light or any combination of these factors. If any of these factors are present in the application the designer or end-user must establish the effect of these exposures and reduce the published maximum housing load accordingly.

To maximise load carrying capacity it is recommended that washers are used with the fixing bolts. Tables 1, 2 and 3 also detail maximum fixing bolt tightening torques.

Static electricity generation

Static electricity may be generated by Life-Lube® bearing units under certain application conditions.

Life-Lube® bearings are therefore not recommended for use in explosive or flammable environments. If Life-Lube® bearing units are used in flammable or explosive applications the bearing insert must be earthed.

Housing strength

Life-Lube® bearing inserts

Life-Lube® bearing inserts have martensitic stainless steel rings, balls and set screws, and austenitic stainless steel cage and flingers.

Life-Lube® bearing inserts are lubricated with NSK's own oil-impregnated material, Molded-Oil™. Molded-Oil™ consists of lubricating oil and polyolefin resin that has an affinity for oil. Oil slowly seeping from this material provides ample lubrication to the bearing for extended periods. Relubrication is not necessary for Life-Lube® Molded-Oil™ inserts.

Recommended operating temperature and allowable speed

Molded-Oil™ inserts are recommended to operate from -15 to +80°C. However, operating temperature should be below +60°C when the bearing is operated under continuous use.

Allowable speed:

dn value : 12×10^4 max

(dn = bore diameter in mm x speed in rpm)

Remarks: This recommended operating temperature range and allowable speed applies to all units with Molded-Oil™ inserts. Contact NSK when your application exceeds these recommendations.

Materials

| | Parts | Materials |
|-----------------|---------------|---|
| Bearing | Bearing Rings | Martensitic stainless steel (equivalent to SUS40C) |
| | Ball | Martensitic stainless steel (equivalent to SUS44C0) |
| | Flinger | Austenitic stainless steel (equivalent to SUS302) |
| | Seal | Nitrile rubber |
| Bearing housing | Set Screw | Martensitic stainless steel (equivalent to SUS410) |
| | | Thermo Plastic PBT |

Set screw tightening torques

Set screws for Life-Lube® bearing inserts are manufactured from stainless steel and can fracture if overtightened. The limiting set screw torques listed in Table 5 should not be exceeded.

Recommended tightening torques for set screws

| Insert designation | Designation of set screws | Maximum tightening torque (Nm) |
|--------------------|---------------------------|--------------------------------|
| F-UC204/LP99 | M5 x 0.8 | 3.9 |
| F-UC205/LP99 | M5 x 0.8 | 3.9 |
| F-UC206/LP99 | M6 x 0.75 | 4.9 |
| F-UC207/LP99 | M6 x 0.75 | 5.8 |
| F-UC208/LP99 | M8 x 1 | 7.8 |

Inner ring tolerances

Units: μm

| Nominal bore diameter d | | Bore diameter | | | Width | | Radial runout (ref.) |
|---------------------------|----------|----------------------------|------|-------------------------|-------------------------|------|----------------------|
| over mm | incl. mm | Δd_{mp} deviations | | ΔVdp variations | ΔB_s deviations | | |
| high | low | max | high | low | max | | |
| 18 | 31.750 | +18 | 0 | 12 | 0 | -120 | 18 |
| | 31.750 | +21 | 0 | 14 | 0 | -120 | 20 |

Δd_{mp} : Mean bore diameter deviation.

ΔVdp : Bore diameter variation.

ΔB_s : Inner ring width deviation.

Outer ring tolerances

Units: μm

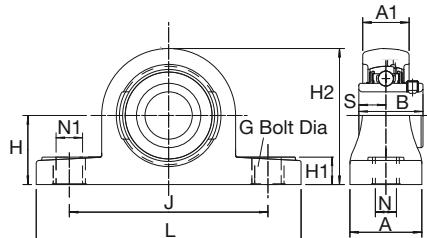

| Nominal outside diameter D | | ΔD_m deviations | | | Radial runout (ref.) |
|------------------------------|----------|-------------------------|-----|-----|----------------------|
| over mm | incl. mm | high | low | max | |
| 30 | 50 | 0 | -11 | | 20 |
| 50 | 80 | 0 | -13 | | 25 |
| 80 | 120 | 0 | -15 | | 35 |

ΔD_m : Mean outside diameter deviation.

The lower deviation figure of ΔD_m does not apply within a distance of $1/4$ the width of the outer ring from either side.

Special Products and Bearing Solutions

Additional products

By design the Self-Lube® family of mounted units can be combined to form alternative ranges of insert and housing depending on customer requirements. This is relatively straightforward but NSK should always be consulted.

In addition NSK recognises the need for 'tailor made' solutions and is always willing to help customers who have a requirement for something out of the ordinary, commensurate with meeting certain price and volume criteria.

NSK has facilities to make special batches of product combinations such as:

- › Alternative insert / housing combinations
- › Special grease types and grease fills
- › Alternative seal combinations – flinger seals, triple lip seals and shields

Please contact NSK with your requirements.

HLT Self-Lube®

HLT Self Lube® inserts are designed to operate reliably at extreme temperatures, within the range -40°C to +180°C. HLT inserts are available across the entire Self-Lube range.

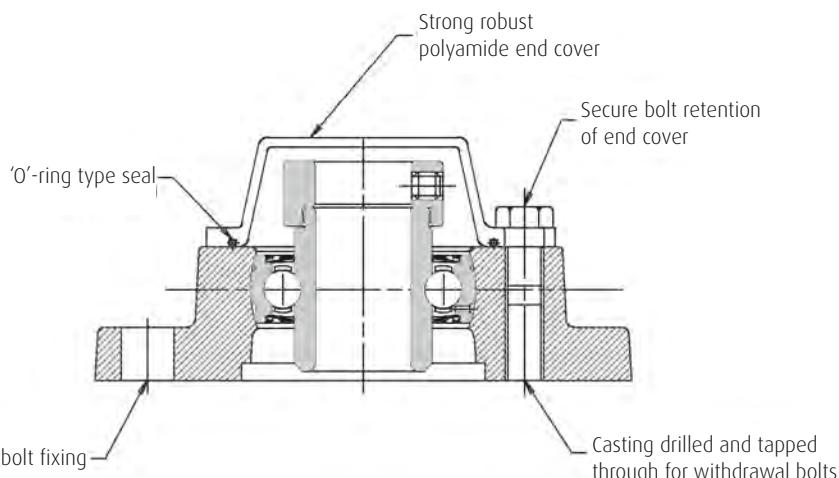

HLT Inserts have:

- › High strength steel cage
- › Special internal geometry
- › High performance Kluber grease
- › Silicone seals
- › Optional protector
- › Relubrication facility

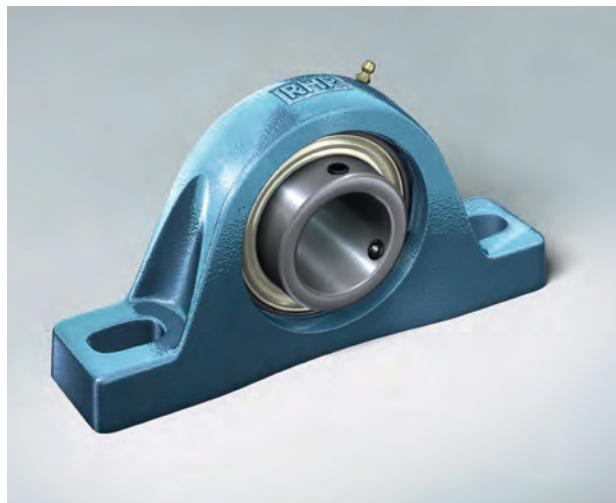

Special Housing Options

Where there are requirements for original equipment NSK can design special housings to accommodate customers' requirements subject to volumes required.

A typical example of this is shown below.

Conversion factors from SI units (continued)

| Parameter | SI Unit Names of unit | Symbol | Unit other than SI Name of unit | Symbol | Conversion factor from SI unit |
|------------------------------|----------------------------|-------------------|------------------------------------|-------------------|-----------------------------------|
| Energy | Joule (Newton · metre) | J (N · m) | Erg | erg | 107 |
| | | | Calorie (International) | cal _{IT} | 4.186 8 |
| | | | Kilogram-force metre | kgf · m | 1/9.806 65 |
| | | | Kilowatt hour | kW · h | 1/(3.6 · 10 ⁶) |
| Power | Watt (Joule per second) | W (J/s) | Metric horse power hour | PS · h | ≈ 3.776 72 · 10 ⁻⁷ |
| | | | Kilogram-force metre per second | kgf · m/s | 1/9.806 65 |
| | | | Kilocalorie per hour | kcal/h | 1/1.163 |
| | | | Metric horse power | PS | ≈ 1/735.498 8 |
| Dynamic Viscosity | Pascal second | Pa · s | Poise | P | 10 |
| Kinematic Viscosity | Square metre per second | m ² /s | Stokes | St | 10 ⁴ |
| | | | Centistokes | cSt | 10 ⁶ |
| Temperature | Kelvin, Degree celsius | K, °C | Degree | °C | (See note (1)) |
| Electric Current | Ampere | A | Ampere | A | 1 |
| Magnetomotive Force | Volt | V | (Watts per ampere) | (W/A) | 1 |
| Voltage, Electromotive Force | Ampere per metre | A/m | Oersted | Oe | 4π/10 ³ |
| Magnetic Field Strength | Tesla | T | Gauss | Gs | 10 ⁴ |
| | | | Gamma | γ | 10 ⁹ |
| Electrical Resistance | Ohm | Ω | (Volts per ampere) | (V/A) | 1 |

Note (1) The conversion from T(K) into θ(°C) is $\theta = T - 273.15$ but for a temperature difference, it is $\Delta T = \Delta\theta$. However, ΔT and Δθ represent temperature differences measured using the Kelvin and Celsius scales respectively.

Remarks The names and symbols in () are equivalent to those directly above them or on their left.

Example of conversion 1N=1/9.806 65kgf

Prefixes used in SI system

| Multiples | Prefix | Symbols | Multiples | Prefix | Symbols |
|------------------|--------|---------|-------------------|--------|---------|
| 10 ¹⁸ | Exa | E | 10 ⁻¹ | Deci | d |
| 10 ¹⁵ | Peta | P | 10 ⁻² | Centi | c |
| 10 ¹² | Tera | T | 10 ⁻³ | Milli | m |
| 10 ⁹ | Giga | G | 10 ⁻⁶ | Micro | μ |
| 10 ⁶ | Mega | M | 10 ⁻⁹ | Nano | n |
| 10 ³ | Kilo | k | 10 ⁻¹² | Pico | p |
| 10 ² | Hecto | h | 10 ⁻¹⁵ | Femto | f |
| 10 ¹ | Deca | da | 10 ⁻¹⁸ | Ato | a |

Temperature conversion tables

Appendix table 4 °C-°F conversion table

(Method of using this table) For example, to convert 38°C into °F, read the figure in the right °F column adjacent to the 38 in the center column in the 2nd block. This means that 38°C is 100.4°F. To convert 38°F into °C, read the figure in the left °C column of the same row, which indicates that the answer is 3.3°C.

$$C = \frac{5}{9} (F - 32)$$

$$F = 32 + \frac{5}{9} C$$

| °C | °F | °C | °F | °C | °F | °C | °F |
